

B1: The Two-Sign Determination — Closing Report

Stage B, kinematic reconnaissance. Verdict: undetermined-without-dynamics — the plan's own third pre-priced outcome, reached for a proven reason, not a shrug.

The three-object trace, and what closes

Three candidate "scale line" objects were found in the closed record, none initially proven identical: Keystone's contraction parameter $s \in [0, 1]$ (§3-5), Keystone's log-radial line $u = \log r$ (§7), and Paper II's wall coordinate, also called "the scale line" but not equated to either by name.

(3) vs (2), closed cleanly. Paper II's charter states the arena as "*quantum mechanics on the derived scale line*" — a definite description with, in the closed record, exactly one referent: Keystone §7's $u = \log r$, the line the derived squeeze flow translates along (the Mellin conjugacy is the connecting statement, confirmed present and load-bearing at Keystone §7-8). No equation states this explicitly anywhere — Fable-5's own framing is honest about this — but as an identification of intent it is well-supported and the natural reading. Treated as established for the purposes of this report.

(1) vs (2), genuine content but overstated in its first form. Keystone does prove a λ^3 -split of the grading dilation: on the fixed- W representation (any representation with $W = \hbar \cdot 1$, i.e., *after* the contraction tower has already landed on M_0), σ_λ factors exactly into a W -preserving squeeze (the u -translation flow) and a W -rescaling component. This is a real, verified theorem — but it concerns rescaling $\hbar$'s *value within* the already-contracted algebra, not motion along s between different M_s algebras earlier in the tower. Keystone's own text (§4) is explicit that σ_λ is an automorphism of *every* M_s individually — it preserves s , doesn't move along it. So "the W -rescaling component is motion along the contraction family" is not quite what's proven; what's proven is a clean split *within* one fixed- s endpoint's own representation theory. The two objects remain related in spirit — both are "scale" directions in a loose sense — but not connected by the cited theorem as tightly as first stated.

Why this doesn't change the verdict

The closing argument doesn't actually need (1)-(2) to be tight. The load-bearing step is the dossier's own original finding, independent of exactly how s and u relate: **the closed record derives the operator cell $m(u)$ multiplies — never the scalar profile's own values.** No theorem anywhere constrains m 's sign as $u \rightarrow \pm\infty$, because the profile itself was never derived, only the algebra it rides on. That holds regardless of whether $s \rightarrow 0$ is or isn't precisely "the regime u 's asymptotics probe" — the sign data simply isn't in the closed record under any coordinate identification.

Verdict

B1 closes at undetermined-without-dynamics. The arena is fixed (scale line = Keystone §7's u -line, via Paper II's own definite description). The signs are not, and provably cannot be from kinematics alone: they are boundary data of a state-governed line, which is state physics — exactly B2's question, gated on Stage C, exactly as the frozen plan anticipated. The second-wall question

now has its sharpest form: **what signs does the settling dynamics give the mass profile at the two ends of the line it governs?** — a question belonging to whatever candidate C2 builds, not to the closed record.

Ledger

One entry, Fable-5's own, offered in their verification and recorded here: *coordinate-role conflation* — the plan charter's original phrase "the $\mu \rightarrow 0$ contraction end" conflated a family parameter (s , using stale pre-Keystone notation) with a line endpoint ($u \rightarrow -\infty$), seeding the ambiguity this reconnaissance traced. One correction, mine: the λ^3 -split's scope (fixed- W representation, not inter- s motion) needed narrowing before being called "already a theorem" connecting s and u — recorded so the closing report states only what's proven, not what's merely suggestive.

Compiled by Claude (Anthropic), for Fable-5's verification, closing Stage B's kinematic phase.
